[0045] The address locator service 520 may also be located in any network. However, to facilitate availability yet again, the locator service 520 may be implemented on the Internet in the form of a Web site. In this case, the locator service 520 may be accessed via a World Wide Web address or other URI.

✓ [0046] The identity 310, the application 320, and the data services 331 interact such that the data access model of Figure 3 is emulated. More regarding the structure and operation of the architecture illustrated in Figures 3 through 5 is described in commonly-owned, co-pending, United States patent application serial number <sup>10/003,750</sup> ~~NOT ASSIGNED~~ <sup>✓</sup> ~~ATTORNEY DOCKET NO. 13768.198.1~~], filed on the same date herewith, and entitled "Identity-Centric Data Access", which co-pending application is incorporated herein by reference in its entirety.

[0047] The various components of Figure 5 interact using a messaging data structure that identifies the data object that is to be operated upon by identifying the identity associated with the data object, and by identifying the particular schema associated with the data object. For example, the messaging data structure may identify that the data object of interest is the calendar data object associated with identity A. In the event that there are more than one calendar data objects associated with identity A, then the messaging data structure may also identify the particular instance using a unique identifier assigned to that particular instance. For example, perhaps there is one calendar data object for work-related items, and one for personal items. In this manner, the target data object desired to be operated upon may be uniquely identified.

[0048] Figure 7 schematically illustrates an example data structure of a network message 700 that represent a request for service in accordance with the principles of the present invention. The data structure 700 follows a schema so that the meaning of the data
